DSAI L2

Consultant, JR11+ = Tier 2 SEA Competency

Key Tasks and Performance Standards

Design and run end-to-end data project

Given a business question, design the project, from formulating hypotheses, exploring the data, performing robust analysis, communicating the finding to users, and deriving the value, whether it rejects hypotheses and leads to new discovery, or it confirms hypotheses and builds deeper confidence in an assessment. Solution could be simple yet it should be robust - this means the need to assess feasibility of implementation or rigor of methodology.

<u>Performance Standards:</u>

- Demonstrate mastery of the data science process
- Bring value to users by refining business questions
- Deliver new discoveries and/or instil deeper confidence in analytical insights

Address specialized operational problems by applying both data science and business domain knowledge

Specialized problems mean that the solution was neither obvious nor straightforward. Possible reasons:

- Data characteristics are significantly different, e.g. unavailable data, masked data for security/anonymity.
- Operational use case is non-trivial, e.g. suspicious activity monitoring via real-time analysis of multiple data streams.
- Solutions are not commonly available, e.g. not accessible to users in generally used platforms.

Possible approaches include:

- Develop bespoke data solution to generate actionable insights with data science techniques for decision-making
    - E.g. Different types of analysis on <removed specific example but whatever really>

    - Where relevant, publish solution to common issues

- Design and train specialized, performant and robust ML solutions, incorporating business or domain expertise
    - E.g. PDNS pivoting (for APT tracking)

- Build analytical capabilities and deploy tools, APIs, and / or systems that provide analytical or investigative capabilities for a wide audience
    - E.g. apps on (removed golink hyperlink)
    - Where required, work with MLEs to deploy scalable solutions. Systems should actually solve users' problems / help them to save time

Performance Standards:

- Demonstrate sufficient competency in data science to solve non-trivial problems.
- Demonstrate rigor in analysis.
- Demonstrate strong business understanding (domain and process knowledge) in the implemented solution
- Plan, manage, and execute a data science project end-to-end

(Community Contribution) Active participation in community-wide initiatives

Influence beyond area of command and serve a wider community to help grow the technical competency of the community by participating in community-wide initiatives, for example:

- Conduct sharing session
- Create reusable artefacts

Performance Standards:

- Demonstrate ability to influence the community to adopt useful technologies and best engineering/scientific practices
- Demonstrate good knowledge of common problems and limitations faced by the community

Competencies

I'm lazy to edit twice so go to the master list and run this query in your head:

```
SELECT
  DSAI_MAP.Competency,
  DSAI_PL.PL,
  DSAI_MAP.Description
FROM
```

```
DSAI_MAP
INNER JOIN DSAI_PL
  ON DSAI_MAP.Competency = DSAI_PL.Competency
  AND DSAI_MAP.L2 = DSAI_PL.PL;
```
