DSAI L3

Senior Specialist, JR10 = Tier 3 SEA Competency (STS)

Key Tasks and Performance Standards

Address complex organizational problems by applying data science with deep analysis of the insights generated

Anticipate issues, identify opportunities, and work on open-ended problems where outcomes can be effectively achieved with data science and analytics. The complex problems will require breaking down into smaller and manageable components. This requires leading the efforts to architect and implement through team effort or leveraging external resources.

The data solution developed should be reusable or reproducible by others in the community. This also means being able to articulate the complex problem and convince the different stakeholders for actionable outcome / decision-making such as willingness to invest resource to develop and/or adopt the solution.

Possible approaches include:

- Lead technical projects and deliver new ML/AI capabilities that meet organizational needs
    - To make new things possible or to make existing things easier
- Develop methodology, approach, and/or capability to enable analysis and insights generation for complex issues
    - Such projects usually have longer time frame with novel elements of experimentation / exploration or, reusable across data domains

<u>Performance Standards</u>

- Identify, diagnose, and solve open-ended problems
- Demonstrate mastery in understanding and applying choice of data science models / algorithms with deep analysis on the insights generated
- Develop bespoke data solution useful for the community and the organization

(Technical Leadership) Provide technical guidance to your group

Provide technical leadership to lead technological advancement and improve scientific performance by guiding the group to adopt the right strategies, solution, methodologies, practices, technologies and culture. This may include:

- Place judgement on practices and technologies to adopt and abort
- Convince extended stakeholders to prioritise and manage system changes
- Measure engineering/scientific & team performance

Performance Standards

- Demonstrate good knowledge of trending technologies, processes, best practices and modern methodologies to measure scientific performance
- Understand business needs and how it translate technically

(Community Contribution) Being an active and effective contributor in the community

Influence beyond area of command and serve a wider community to help grow the technical competency of the community by being an active and effective contributor in the community, for example:

- Being a significant contributor to at least one track of work
- Be an effective technical mentor within section

This requires good knowledge of the different community virtual groups, tech knowledge management (KM) sites and community initiatives.

Performance Standards

- Demonstrate effective coaching and mentoring for team members
- Ability to influence the community to adopt useful technologies and best engineering/scientific practices

Competencies

I'm lazy to edit twice so go to the master list and run this query in your head:

```
SELECT
  DSAI_MAP.Competency,
  DSAI_PL.PL,
  DSAI_MAP.Description
FROM
  DSAI_MAP
  INNER JOIN DSAI_PL
    ON DSAI_MAP.Competency = DSAI_PL.Competency
    AND DSAI_MAP.L4 = DSAI_PL.PL;
```
